**Figure 19**

## Figure 20

Signal Name	Use
EMD	Expansion Module Data - a bi-directional signal used to communicate the address and data to and from the module.
EMC[1:0]	Expansion Module Clocks - One clock is used to access expansion I/O external to the PLC, while the other is used to access I/O that is local to the PLC that does not connect directly to the ASIC.
XA_OD	Address/Output Disable - a dual function signal used to reset the state machine in the modules on the first clock of each access cycle (active low) and used to indicate output disable when a fatal error has been detected (active low for an RC time constant).
EMDDIR	Expansion Module Data Direction - this signal indicates the direction of data flow on the EMD signal line. 0 - Data is driven by the module to the PLC 1 - Data is driven by the PLC to the module
EMA[2:0]	Expansion Module Address - these signals are daisy chained from PLC to module to module. The value input to a module becomes that module's address. The module will output its address plus one to the next module. The PLC drives these signals to 0 so that the module connected to the PLC has the address of 0.
+5V	5 volt power supply - Two signals carry +5 volts.
GND	Power supply return - Two signals carry ground.

**Figure 34d**

Housing	Height	Width	Depth
CPU 221	80 mm	90 mm	62 mm
CPU 222	80 mm	90 mm	62 mm
CPU 224	80 mm	120.5 mm	62 mm
CPU 226	80 mm	190 mm	62 mm
8 Point I/O Module	80 mm	46 mm	62 mm
16 Point I/O Module	80 mm	71.2 mm	62 mm
32 Point I/O Module	80 mm	125 mm	62 mm
Intelligent Module	80 mm	90 mm	62 mm
